

Each time a new feature is added to the SolarVu energy portal, more faults can be identified to ensure O&M staff get timely warnings of potential problems. At the end of each day, the daily energy from each inverter is compared to the others. For the same weather conditions each string inverter should produce the same output. If the daily energy output from one inverter is less that the others by a percentage set with the user adjustable energy ratio alarm setpoint, a warning email will be sent. A link to the PowerWatch daily energy graphs is included for further analysis.

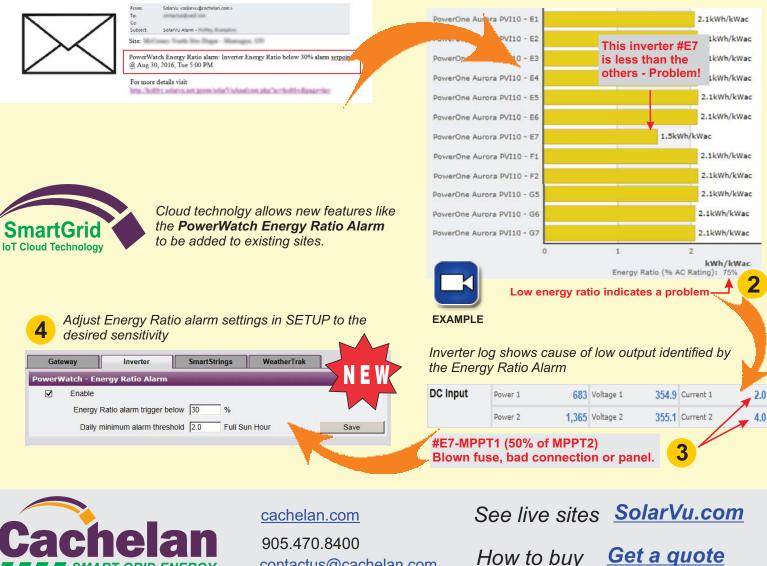

The new **PowerWatch Energy Ratio Alarm** has been activated on existing SolarVu sites so all owners can immediately benefit with higher revenue from improved maintenance.

Receive a Low Energy Ratio Alarm at the end of the day with a link to the energy output graph for analysis

SMART GRID ENERGY

Low output inverters are obvious in the Energy Ratio chart. Click on the low output inverter bar to go to that inverter 30 day log to analyse inverter values.
